# 9000B Bariatric Bed

## Ultra-low bed for bariatric patients/residents.

The 9000B bed combines all functions that are essential for the recovery of overweight patients/residents & the working ergonomics of nursing staff.

The height can be memorised for each patient/resident, ensuring the optimum position for lifting & transferring, & facilitating rehabilitation for discharge from hospital. With a minimum height of 21 cm, the patient/resident is safe.

## Improved working conditions for caregivers

The bed promotes the mobilisation & autonomy of patients/residents, thus reducing low back pain for caregivers.

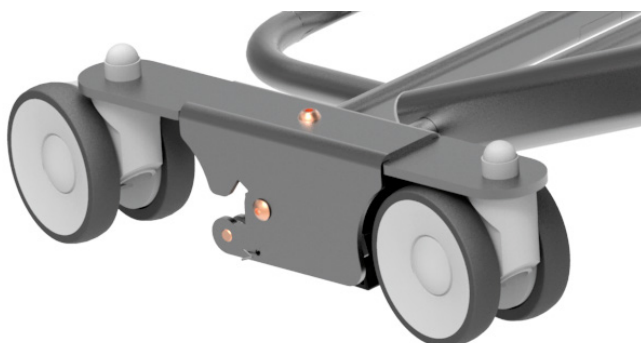

## Preservation of patient/resident dignity

The armchair position humanises the patient's/resident's interaction with visitors.

## High manoeuvrability

The set of 8 twin 100mm wheels divides the efforts by 4 compared to conventional 150mm wheels.

## Secure the patient overnight

The ultra-low position 21 cm from the ground (castors Ø 100mm) ensures perfect safety for patients/residents at risk. The braking of the bed is automatic in the ultra-low position.
